## FUNCTION OF LOCK SYSTEMS

# Precisely security

Size does not necessarily guarantee the best possible security. Lock systems do not always need to be made heavier and larger. We conceive intelligent solutions and develop these into lock systems which are far ahead of their time.

Security from DOM. That is sufficient.

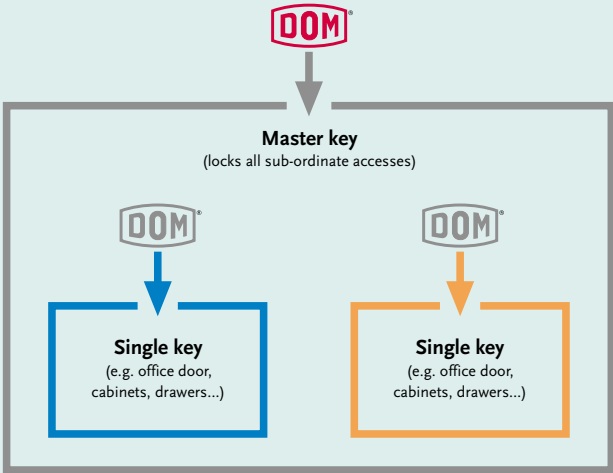

Say goodbye to overloaded key rings. By choosing a DOM lock system, you have the freedom to grant different access rights with one and the same key. Whether in a linear hierarchy from top to bottom, or by a complex and differentiated structure. The professional DOM lock systems allow you to make exactly the arrangements you require. Without a huge bunch of keys, and satisfaction in the knowledge that you have chosen the best for your security.

**THE MASTER KEY SYSTEM**

# One key for everything

A higher-level key – the master key - locks all installed cylinders, each of which are locked differently. All sub-ordinate keys only function in a certain area or for certain cylinders locked by the same keys. The master key can nevertheless open all these cylinders. The master key system – the perfect solution for private homes, office complexes and for small and medium-sized firms.

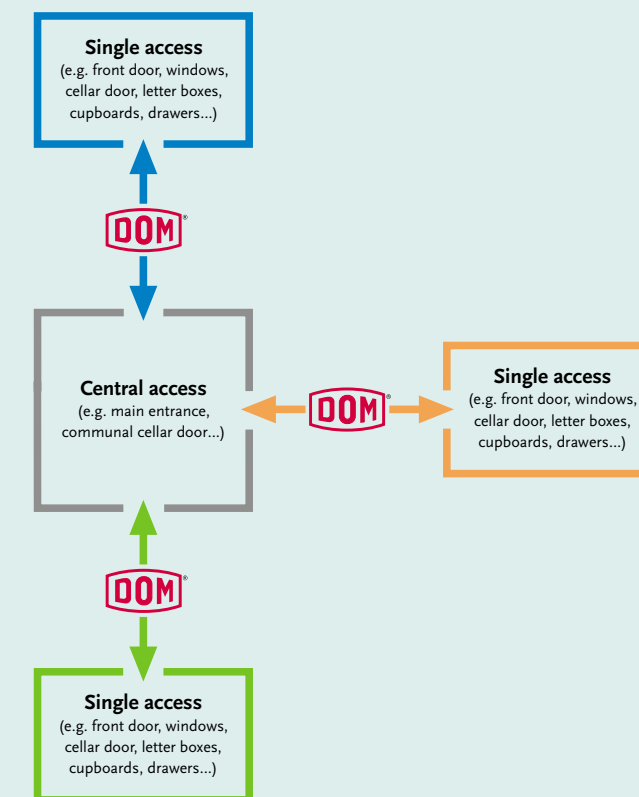

## THE CENTRAL LOCK SYSTEM

# Central accessibility for all

In this case, a key operates individual access points, although also the cylinders of central access points. The central lock system is primarily used in blocks of rented flats. Individual accesses are then the front door of each flat and possibly other cylinders inside. Examples of central access points are the main entrance, communal cellar, shared garage access etc.. Individual locks for letter boxes and meters or the tenants' own cellar can likewise be assigned to the front door key of each flat.

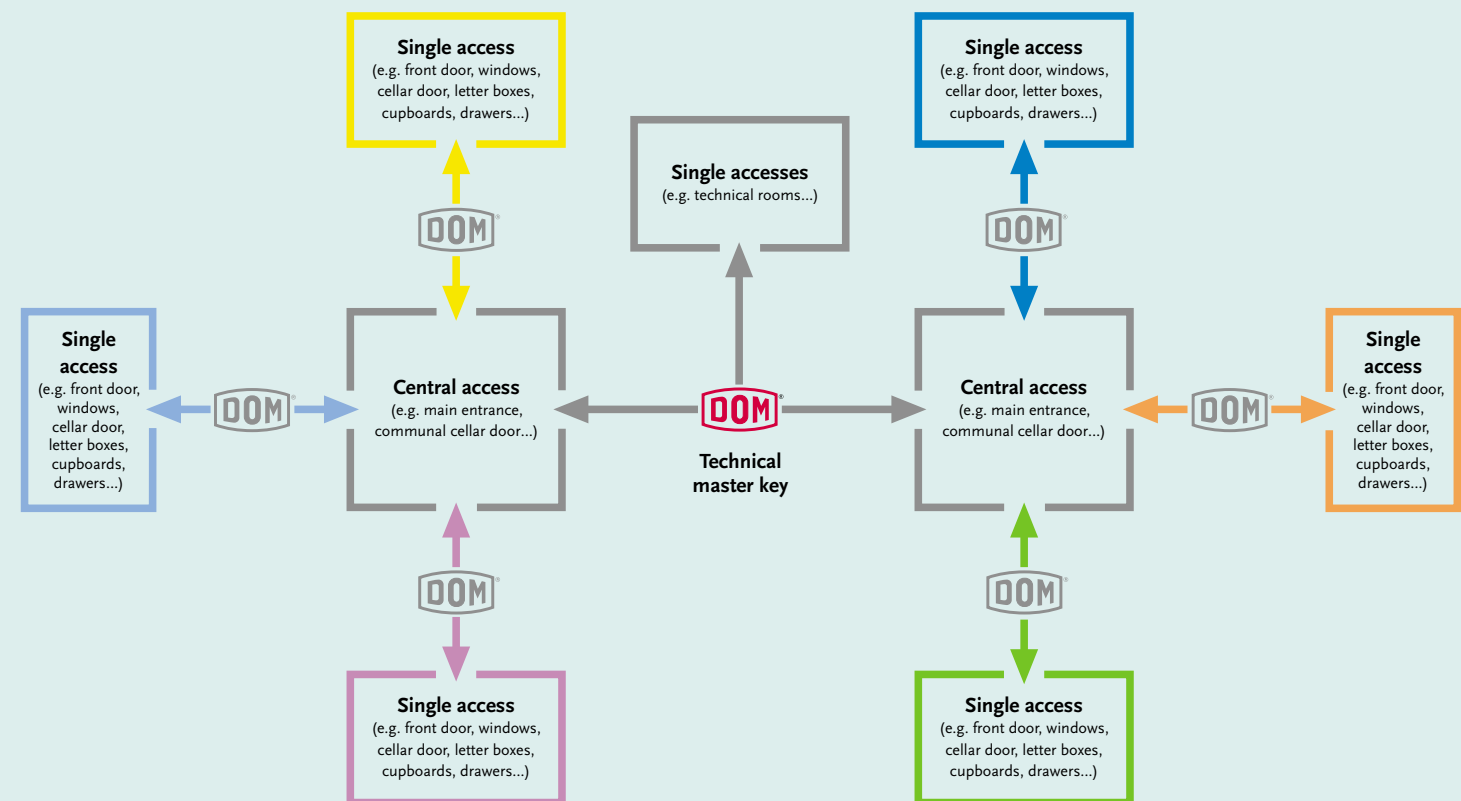

## THE CENTRAL MASTER KEY SYSTEM

### Complex structure

It is possible to combine several central lock systems alongside each other and allocate a higher-level, technical master key. This is called a central master key system. This master key opens central cylinders as well as doors to which the holders of lower-level keys are not allowed access, e.g. technical rooms such as the boiler room.

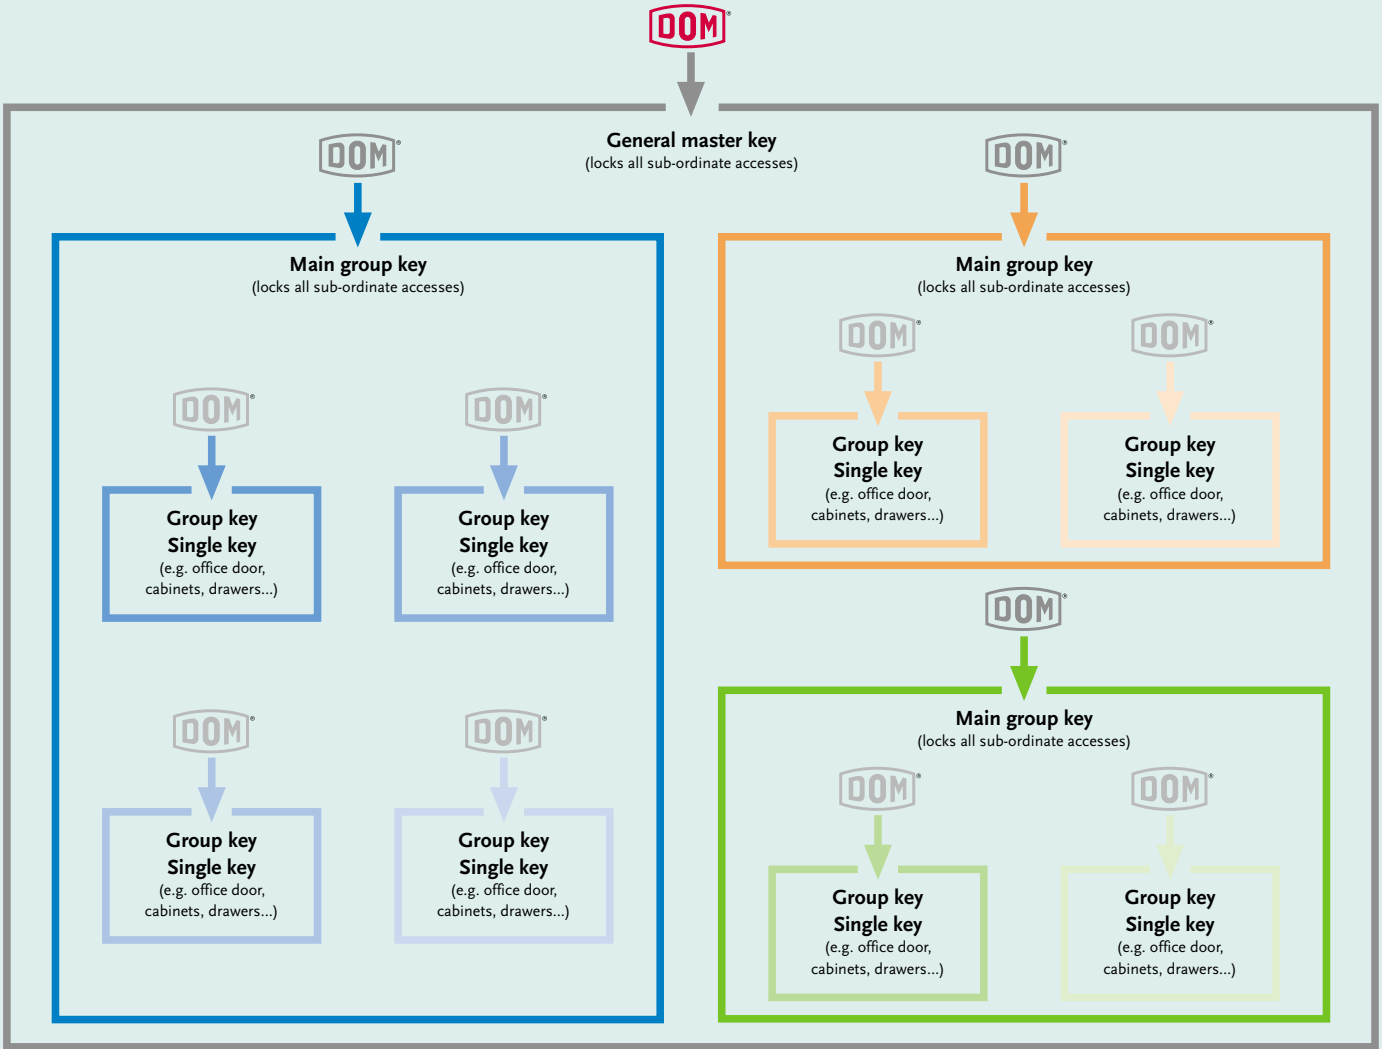

**THE GENERAL MASTER KEY SYSTEM**

# Differentiated structure

In principle, this brings together several master key systems, to which a higher-level, general master key is allocated which can open all cylinders. The group keys have further higher-level functions. In ascending hierarchical order, a distinction is made between sub-group keys, group keys, master group keys and general master keys. For use in large-scale premises and medium-sized firms with extensive organisations. DOM implements such lock systems featuring more than 50,000 individual locks. Central locking functions can additionally be incorporated into the structure of this type of system.

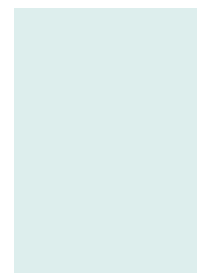

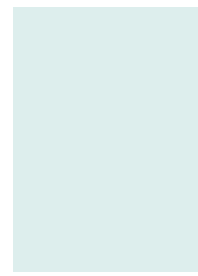

**PRODUCT LINES AND SYSTEM TYPES**

# You have the choice

DOM offers you the choice of different systems, allowing you to set up varied lock arrangements: conventional lock technology (the RS series), reversible key technology (the ix series) and the high-strength DOM diamant system. In addition to these, the DOM ELS electronic lock system sets new standards in security technology and options of comfort. We offer DOM ELS in an off-line version and – as a high-end solution – in the on-line version. The table below shows which type of system comes into question for you.

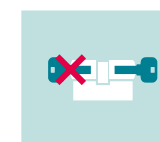

System type	⚙️		🔑			🔒	📡	
	RS 5	RS 6	ix 5 HT	ix 6 KG	ix 10 KG	diamant	ELS-Off-Line	ELS-On-Line
Registered cylinders	•	•			•	•	•	•
Central lock system	•		•	•	•		•	•
Central master key system	•		•	•	•		•	•
Master key system	•	•	•	•	•	•	•	•
General master key system	•	•	•	•	•	•	•	•

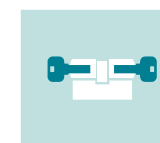

**COUPLING SYSTEMS AND SECURITY CIRCUIT**

# Security from A to Z

The strength of a cylinder is its main security feature. However, certain additional functions and features on top of this guarantee that a lock – particularly in lock systems – ensures reliable protection at all times. Different coupling systems, accordingly suited for a family or nursing home, offer comfort in everyday use. The DOM security circuit provides added, all-round protection.

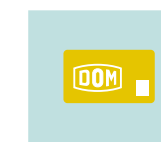

**Normal coupling**  
Not possible to lock if a key is inserted on the inside.

**Cylinder locks both sides**  
A door can basically be unlocked by any matching key, even if a key is inserted on the inside.

**Cylinders for every application**  
High-quality DOM technology is also available in special cylinder forms which are used in various places: Garage doors, exit doors, window handles, balcony doors, letter boxes, gate controls, padlocks etc. You can even integrate furniture locks into your lock system.

**DOM security circuit**  
Apart from high-quality control and the manufacturer's guarantee, the security card belongs to the DOM security circuit. It alone gives the authority to have copies made of original DOM keys.
